RESEARCH INTERESTS

Environmental Economics, Labor Economics

EDUCATION

2020 - 2025	Ph.D. in Economics, Department of Economics,
(expected)	University of Gothenburg
	Supervisors: Prof. Jessica Coria and Prof. Mikael Lindahl
	Dissertation Title: Essays in Environmental and Labor Economics
2024	Research Visit: EnergyEcoLab, UC3 Madrid (Spring)
2017 - 2019	M.Sc. in Economics, Department of Economics,
	University of Gothenburg
	Thesis: $Temperature \ \mathcal{E} \ Exports$ - $Evidence \ from \ the \ United \ States$
2018	Exchange Semester, Solvay Brussels School of Economics & Management,
	Université Libre de Bruxelles (Spring)
2014 - 2017	B.Sc. in Economics, Department of Economics, University of Gothenburg

Work in Progress

Carbon Taxation, Firm Performance, and Labor Demand [JOB MARKET PAPER]

This paper investigates the environmental and economic effects of carbon taxation in Sweden, and their implications for labor demand. Using matched employer-employee data from the Swedish registers for the years 2004-2018, I estimate the effects of a reform that increased the stringency of the tax for a subset of firms in the manufacturing sector. Using a difference-in-difference framework, I find that the reform significantly reduced emissions among treated firms. However, it also reduced the employment of workers without a high school degree. In addition, I find that negative employment impacts are concentrated among emission-intensive firms, which face the largest cost increases when carbon tax rates rise. The results show that carbon taxation, while effective at reducing emissions, may have strongly heterogeneous

employment impacts, and that complementary policies might be needed to address labor market inequalities when implementing climate policy.

Carbon Taxation and Local Labor Markets

This project studies the effects of a carbon tax reform on local labor markets in Sweden. I exploit spatial variation in exposure to the reform which removed industrial rebates to the carbon tax between 2011-2018, based on the geographical distribution of affected firms. Using matched employer-employee population data and a continuous difference-in-difference estimator, I find no signs of negative effects on individuals' career trajectories, measured by employment, income and mobility. The heterogeneity analysis reveals similar zero effects regardless of individuals' education, gender, or age. A central conclusion from the analysis is the importance of controlling for the correlation with the effects of the financial crisis, which led to permanent employment effects for low-educated workers. The result indicates low distributional costs of an increasing carbon tax after allowing for local spillovers.

Climate Policy Shocks and Wage Adjustments

This project studies rent sharing between firms and workers exposed to exogenous shocks induced by climate policy. Following the previous literature on productivity shocks and wage adjustments, I exploit fluctuations in permit prices under the European Union Emissions Trading System (EU ETS) to study the effects on profit and wages among Swedish regulated firms. I use matching techniques, comparing regulated firms with unregulated firms with overlapping characteristics, in combination with time variation in permit prices, to identify the effects of shocks to climate policy stringency. I allow for different effects for net buyers versus net sellers of pollution permits, in order to investigate whether wage effects depend on the sign of the shock.

This paper estimates the effect of exogenous short-term temperature changes on the economy of the United States, using high-resolution data on monthly exports, which has not been previously exploited in the literature. The detailed disaggregation of U.S. export data into sectors enables a top-down estimation of the net effect of temperature, while also identifying potential mechanisms at the micro level. Using an econometric specification that allows for high parametric flexibility, I find significantly negative effects of both high and low temperatures. The magnitude of the effects corresponds to an average reduction of annual U.S. exports by 0.20%, following a uniform 2°C temperature increase. Industry heterogeneity in the temperature effect suggests disparate mechanisms behind hot and cold days, which are important to take into account when forecasting the future economic damages of climate change in the United States.
